                                                                                                                                          The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                modify such PTP; or (b) alter inducible signalling pathways in which PTP are involved. These agents are potentially useful, in human or veterinary medicine, for treating abnormal cell proliferation or growth (cancer); guest vs. host disease; autoimmune diseases; altergy or other immunosuppressed states; metabolic disorders and cell-cycle abnormalities. This sequence represents one of the PTP enzyme of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue

                                                                      therapy. The human KPP proteins and polymucleotides can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of KPP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) disorders, or infections. They can also be used in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of KPP. The KPP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and compounds or in altering the expression of the target polynucleotide and the expression of the t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human kinases and phosphatases (KPP) for diagnosing, treating and preventing diseases or conditions associated with aberrant KPP expression e.g. cancer, acquired immunodeficiency syndrome, epilepsy, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ramkumar J, Marquis

                                                                                                                                                                                                                 8 contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibod that specifically binds to the polypeptide or its antigen-binding fragment; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid, comprising the polynucleotide, a buffer and an enzyme; a method of detecting an SNP in nucleic acid molecule; a method of detecting a variant polypeptide; and
                             method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises in isolated nucleic acid molecule comprising at least further comprises.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            20-DEC-2002; 2002US-0434778P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
This invention relates to a novel method for identifying genes that are cover-expressed in adipose tissue and as such it provides targets for anti co-obesity pharmaceutical compositions. Specifically, it refers to a high combility group I-C protein (HMGI-C) that is associated with obesity and control is epistatic to leptin, furthermore, it refers to the ob gene where an autosomal recessive trait is linked to obesity and diabetes. The present convention describes performing differential gene expression analysis between the white adipose tissue (WAT) or stromal vascular tissue (SVT) of any two different mice selected from a group consisting of wild-type, continuity of the convention and continues and the encoded proteins thereof were this method novel nucleotides and the encoded proteins thereof were this method novel nucleotides and the encoded proteins thereof were this method novel nucleotides and the encoded proteins thereof were the mitigal that are adipocyte specific, and as such can be used for preventing adipogenesis, diagnosing and treating diabetes, obesity, compounds that can modulate or prevent adipogenesis and treat diabetes or compounds that can modulate or prevent adipogenesis and treat diabetes or cobesity. These compositions exhibit anorectic, antidiabetic and the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                   The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in ar individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lung, bacterial or fungal infection. The present sequence represents a protein encoded by an mRNA sequence of the invention which show altered expression in remal transplantation and expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1256

The invention relates to a novel method for identifying an individual who comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's cultered risk for myocardial infarction in the individual's cultered risk for myocardial infarction in the individual's cultered risk for myocardial infarction in the individual's the specification or its complement and encoding any one of the antered comprising at least complement and encoding any one of the amino color and sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody comprising an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in conspent; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in concleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and composition for identifying an agent useful in treating or preventing composition for treating or prevention may be used in gene therapy. The method is useful in identifying an individual who has an increased or composition for treating or preventing myocardial infarction. The novel detection method has cardiant activity. The method is useful in identifying an individual who has an increased or composition for treating or preventing myocardial infarction. This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.

                                                           method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity the nucleic acids of the invention may be used in gene therapy. The method is useful in identifying an individual who has an increased or decreased risk for developing myocardial infarction and for preparing composition for treating or preventing myocardial infarction. This

                                    transporter, cytoskeletal protein, receptor or transcription factor. polypeptide is useful as an immunogenic composition for eliciting in mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polypurolectides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melan lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence representes the approach of the polypeptides.
expressed protein tag (EPT) isolated from human tissue for ty
profiling. Note: This sequence does not appear in the printed
specification but was obtained in electronic format directly
                                                                                                                                                                                  The invention describes a purified polypeptide, which comprises fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription fac

fragment of a kinase, phosphatase, protease inhibitor, ctransporter, cytoakeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polypucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed constitution but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SXS
fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polynucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed general printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                            phosphatase (PTP) that is reversibly oxidized in a cell by: (i)

subjecting a sample, including a cell that contains at least one PTP, to

conditions that cause reversible oxidation of PTP; (ii) isolating PTP

conditions that cause reversible oxidation of PTP; (ii) isolating PTP

conditions that cause reversible oxidation of PTP; (ii) isolating PTP

conditions that cause of a sulfhydryl-reactive agent (II) that

conditions that caused by PTP, of an invariant Cys in the active

conditions, the level

conditions that an active PTP is present. No details

conditions to these activities are given. The method is used to identify

condity such PTP; or (b) alter inducible signalling pathways in which PTP

conditions, for treating abnormal cell proliferation or growth (cancer);

conditions, for treating abnormal cell proliferation or growth (cancer);

conditions, for treating abnormal cell proliferation or growth (cancer);

conditions, the details allergy or other

conditions that cause sucolumnume diseases; allergy or other

conditions that cause is metabolic disorders and cell-cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                               genes for targeting in the treatment of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis in a mammal array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collageninduced arthritis; and reducing the symptoms associated with collageninduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiarthritic, osteopathic, antigout, antiantlammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention further comprises: a treatment of rheumatoid arthritis; identification of the genes of the genes is the same that it is a superior to the genes of the g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a autoimmune disease or arthritides. The method comprises obtaining a national state of the means analysing gene expression using the means analysing gene expression using the means are the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disease; arthritide; gene expression analysis; rheumatoid arthritis; collagen-induced; immunompressive; antirheumatio antiarthritic; osteopathic; antigout; antiinflammatory; dermatological; immunomodulatory; lupus; ankylosing spondylitis; fibrositis; fibromyalgia; osteoarthritis; gout; juvenile rheumatoid arthritis;

This invention relates to a novel method for identifying genes that are cover-expressed in adipose tissue and as such it provides targets for anti cobesity pharmaceutical compositions. Specifically, it refers to a high mobility group I-C protein (HMGI-C) that is associated with obesity and is epistatic to leptin, furthermore, it refers to the ob gene where an autosomal recessive trait is linked to obesity and diabetes. The present invention describes performing differential gene expression analysis between the white adipose tissue (WAT) or stromal vascular tissue (SVT) of any two different mice selected from a group consisting of wild-type, this method novel nucleotides and the encoded proteins thereof were identified that are adipocyte specific, and as such can be used for preventing adipogenesis, diagnosing and treating diabetes, obesity, thypertension and cardiovascular disease, as well as screening for compounds that can modulate or prevent adipogenesis and treat diabetes or obesity. These compositions exhibit anorectic, antidiabetic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

polynucleotide sequences as mentioned in the specification, or its complement), an isolated antibody, (or its antigen binding fragment) that binds to the above polypeptide, a hybridoma that produces the above monoclonal antibody, a pharmaceutical composition comprising the above antibody and a pharmaceutical excipient, a kit for detecting cancer cells (comprising the antibody cited above, methods for diagnosing cancer or for detecting the presence or absence of cancer cells in an individual, a method for inhibiting growth of cancer cells in an
                                                                                                                                                                                                   The invention relates to an isolated nucleic acid comprising at least 10 contiguous nucleotides of any of the 233 polynucleotide sequences given in the specification, or its conjetement. The nucleic acids encode cancerassociated proteins. Also included are an expression vector comprising the isolated nucleic acid cited above, a host cell comprising the above recombinant nucleic acid or expression vector, a microarray for detecting a cancer-associated (CA) nucleic acid comprising at least one probe comprising at least 10 contiguous nucleotides of any of the above-mentioned nucleotide sequences, an isolated polypeptide (encoded within an open reading frame of a CA sequence selected from any of the 95 control of the 35 contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hypotensive activities. This polypeptide sequence is a human homologue a murine adipocyte specific protein sequence of the invention.

The composition and methods are useful for detecting, diagnosing, preventing and treating cancers, especially lymphoma and leukaemia. These may also be used in screening for agents that modulate cancer. The present sequence is a human CAP protein sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acide, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises: an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  individual, a method for delivering a therapeutic agent to cancer cells in an individual, an electronic library comprising the above polymucleotide or polypeptide (or their fragments), methods of screening for anticancer activity or for a bioactive agent capable of modulating
                                                                                                                                                                                                                                                                                                                                                            Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2004-533949/51.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC the specification or its complement and encoding any one of the amino CC acid sequences given in the specification; an isolated polypeptide CC comprising an amino acid sequence given in the specification; an antibody that specifically binds to the polypeptide or its antigen-binding CC fragment; an amplified polynucleotide containing an SNP given in the Specification and which is between about 16 and 1000 nucleotides in CC length; a kit for detecting an SNP in a nucleic acid, comprising the CC polynucleotide, a buffer and an enzyme; a method of detecting an SNP in a CC nucleic acid molecule; a method of detecting a variant polypeptide; and a CC method for identifying an agent useful in treating or preventing CC myocardial infarction. The novel detection method has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The CC method is useful in identifying an individual who has an increased or CC composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction. Note: This sequence was not shown in the specification. The sequence has come from CC an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best

The invention relates to a novel method for identifying an has an altered risk for developing myocardial infarction. Comprises detecting a single nucleotide polymorphism (SNP)

individual who

얁

Identifying an individual who has an myocardial infarction by detecting a the individual's nucleic acids.

altered risk for developing single nucleotide polymorphism in

N-PSDB;

Claim

10;

SEQ ID NO 1038; 145pp; English.

```
CC the nucleotide sequences given in the specification in the individual's CC nucleic acids, where the presence of the SNP is correlated with an CC altered risk for myocardial infarction in the individual. The invention CC further comprises: an isolated nucleic acid molecule comprising at least C the specification or its complement and encoding any one of the amino CC acid sequences given in the specification; an isolated polypeptide CC comprising an amino acid sequence given in the specification; an antibody that specifically binds to the polypeptide or its antigen-binding CC fragment; an amplified polynucleotide containing an SNP given in the specification and which is between about 16 and 1000 nucleotides in CC length; a kit for detecting an SNP in a nucleic acid, comprising the CC myocardial infarction. The novel detecting a variant polypeptide; and a mucleic acid molecule; a method of detecting are SNP in a nucleic acid molecule; a method of detecting are variant polypeptide; and a method for identifying an agent useful in treating or preventing CC method is useful in identifying an individual who has cardiant activity. The nucleic acids of the invention may be used in gene therapy. The CC method is useful in identifying an individual who has an increased or a composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction. This sequence was not shown in the specification. The sequence has come from CC associated gene containing one or more SNP's of the invention. Note: This capture is a necessary of the invention of the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.

Pred. No. is the number of results predicted by chance to hav score greater than or equal to the score of the result being and is derived by analysis of the total score distribution.
